

# The Moon

\* = test question !!!

2/3/16

The Origin and History of the moon:

- We always see the same side of the moon.
- we never see the Dark side of the moon.

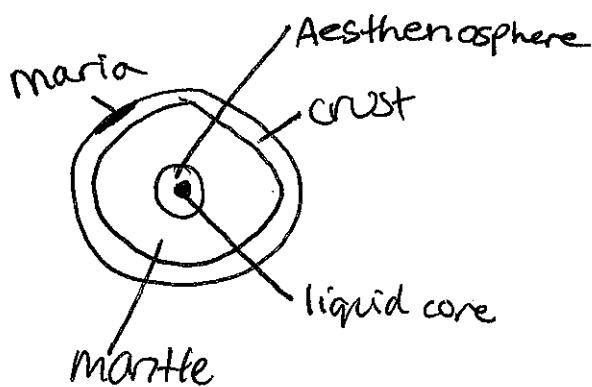

Properties of the moon:

- \* Radius:  $\frac{1}{4}$  radius of Earth
  - \* Mass:  $\frac{1}{80}$  mass of Earth
  - \* average Density:  $3.3 \text{ g/cm}^3$
  - \* rotation: 27.3 days
- Shape: 4 km equatorial bulge

The Moon's Interior:

- some seismic evidence of liquid core
- no lunar magnetic field
- no active volcanos

The moon Drawing

# Moon Notes continued

2/9/14

## Erosion Rates:

High crater density - old surface.

## Lunar Surface Features:

- moon craters ~~that~~ were created billions of years ago by asteroid impacts.
- \* - For many craters you will see long, light streaks of pulverized rock called rays.
- \* - You can also see lunar canyons called rilles.

## Maria

Large smooth dark areas on moon are called maria from the Latin word for "seas"

- singular is mare.
- Mare Tranquillitatis is "Sea of tranquility"
- "When the moon hits your eye like a big pizza pie  
thats amore...."
- When you see a big dark eye on the moon in the sky, thats a mare.
- 17% of moon is covered in Maria.

## The Dark Side of the Moon

- No maria on the dark side of the moon.

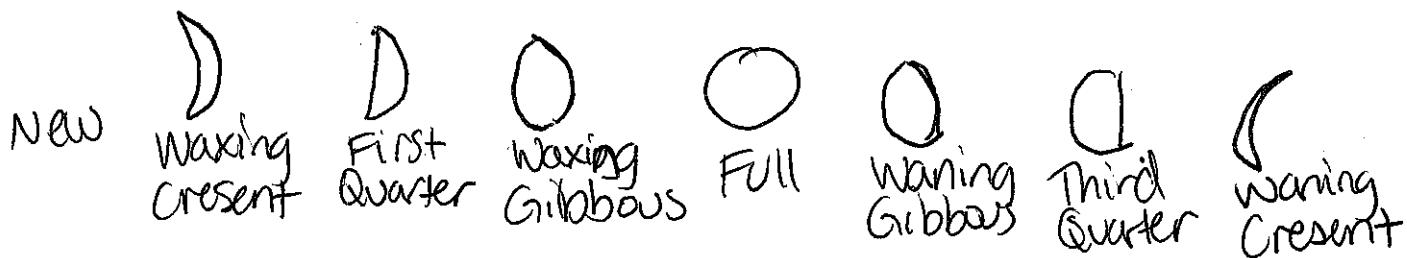

## Phases of the Moon

Wax On → right to left

Wane Off → right to left.

- caused by position of the Earth, the moon, & Sun.
- phases have nothing to do with Earth's shadow.
- plane of Moon's orbit almost the same as plane of Earth's orbit ( $5^\circ$  tilt)
- "moon" light is actually reflected sunlight.

Phases of the moon: 29.5 days

## The moon's different periods:

- The moon goes around the Earth once in 27.3 days \* rotates & revolves once.  
"siderial period"
- The moon goes through one cycle of phases in 29.5 days. \* to go from New Moon - "synodic period" to New moon.
- Orbit of the moon almost lies in same plane as Earth's orbit around the sun.  
- plane is tilted by about  $5^\circ$
